Website Usability & Accessibility

Theme

   The theme that I decided to go with for my website was a kind of modern look with a few elements of blue color. I still currently working on adding colors that go well with each but for now the text is legible and can be seen, so that's a plus. I choose working like this because it lets me experiment with how my website looks and can be changed very quickly.

Links

   I wanted to add images to my links but for now they are the usual text hyperlink. The link will still take the user to that associated website and give them more information on what the link sent them to. It is basically my; GitHub, LinkedIn, and many others. Visual aids will soon be used to guide the user on looks and not on text.

Layout

   Everything is separated in its own pages, like home, project and about. The navigation bar does help in taking the user to whichever tab they so desire. It keeps the website tidy by not adding a lot of bloat to one single page. The Home page is an about me section and what I am currently doing. Projects are based on previous well projects I have completed and classwork that involved me creating interesting software. The about page adds the Website usability & accessibility pdf and other types of links and so on. Text is present clear with its text box and I used a two tone design to make the text not look too plain on the brownish background.
